

Essential Echocardiography Transesophageal Echocardiography For Non Cardiac

**A Comprehensive Guide to the Use of Transesophageal
Echocardiography in Non-Cardiac Applications**

Transesophageal echocardiography (TEE) is a specialized type of echocardiography that uses a probe inserted into the esophagus to obtain images of the heart and other structures in the chest. TEE is commonly used to evaluate the heart for valvular disease, congenital heart defects, and other cardiac conditions. However, TEE can also be used to evaluate a variety of non-cardiac structures, including the esophagus, mediastinum, lungs, and pleura.
